

Dallas DE-02 Inheritance Class Activity

Create java program that simulates bank account transactions for an Individual account and Corporation account (*Note: transactions for each type of account will be coded in their class structure within their main method). Both (Individual and Corporation) account types will deposit any amount to their Checking and Savings member property. Afterwards, make transfers of any amount to their checking (from savings) or to their savings (from checking). If the amount being transferred is greater than available balance, please provide an error notification to user. Do not forget to provide available balance for checking and savings after all deposit transactions are done and after every transfer transaction is attempted.

Bank Account Program
